

Green Home Design Primer

As people recognize how much wastefulness effects the environment, more are turning to green home design. Here is something to consider ... the amount of new or remodeled homes incorporating a green home design was only 2% of the total market in 2005. It is expected that the number of homes incorporating green home design will be at nearly 10% by the year 2010 ... just a few years from now. So if you think that you would like to make your home greener, right now is an excellent time to get started.

Using a green home design for your living space accomplishes many things in addition to helping the environment, including saving you money. Homes that are built or remodeled using green home design concepts are naturally more energy efficient, which translates into savings on your energy bill. Besides saving you money, a home that makes use of green home design is also healthier for everyone living inside the space. These benefits of green home design are realized immediately.

In order to benefit from green home design, it is not necessary to build a home from scratch. You can include green home design concepts in your already existing home. One of the factors that concerns many people about homes using green home design concepts is cost. Right now, it is quite a bit more expensive to build a or remodel a greener living space.

However, the initial sticker shock that you may experience recedes into the background when you begin to weigh the benefits. Plus, you do not have to do a complete overhaul of your immediately - think gradual changes. Plus, as more and more people turn to green home design, the costs will decrease considerably. It is also beneficial to locate a contractor who is familiar with green home design to lower your costs further.

If you decide to incorporate green home design concepts in your home, you can expect to benefit from a home that is cost efficient, healthier for your family, and friendly to the environment as well. Green home design makes use of toxin free building materials which improves the quality of the air inside your home greatly. Use of natural and mechanical ventilation systems in green homes help to filter the air and make it healthier for breathing. Homes that use green home design concepts also experience much lower rate of mold and mildew.

While it may be slightly more expensive initially to use green home design, you will definitely reap the benefits over time. By considering building a new home or remodeling your current home using green home design, you have peace of mind that you are doing your part to reduce your footprint on the environment as well as reaping the natural rewards of green home design.
