

## Why are more people opting for metal buildings

Metal buildings seem to be the new in thing in the construction industry. Due to the nature and benefits of a metal structure over a concrete structure, be it a high rise or a smaller building comprising of two to three floors, most business organizations are going for metal buildings. The demand for the same with developers has seen a steady rise over the last few decades. Steel was first tried as a building material around the year 1855 by Henry Bessemer and it took quite a few decades to be accepted as a standard building material as the benefits of the same starting coming clear in the short as well as long run.

If you look around, metal buildings seem to have sprouted out in all shapes and sizes not just in the United States of America but across the globe including third world countries. Steel has thus remained a metal in demand even during this era of depression. There are a lots of benefits like lower building costs and speedier construction when opting for metal structure and an increasing number of offices and factories are now metal buildings. Building materials are now a days available in different shapes and sizes as pre built components for metal buildings. This has reduced the overall construction costs incurred on manual labor and transportation applicable on making concrete blocks for use in the structure.

There are a number of other benefits as well, the insurance premiums are lower in comparison with a building made of wood and the cost of maintenance and safeguarding is much lower too. A building made of wood would be vulnerable to several types of pests and not to forget fire all of which is hard to contain once spread. Metal buildings also fare better during an earthquake or hurricane as the resistance is much higher due to the compressive strength. Metal building are also more durable and capable of supporting the immense weight of skyscrapers compared to buildings made of wood which can only support a couple of floors.

Metal buildings usually project the picture of a huge construction like shopping malls, multiplexes or huge stadiums seen in the recently concluded Beijing Olympics. This is however now a fact of past as even households and people looking to build homes and small offices are also opting for metal buildings structure. Introduction of computers in the construction industry has come a long way, initially its involvement was limited to design but recently advanced computers have made it possible for engineers to design a building as well as its components on a computer and send it over to a new age factory that would then manufacture the components with high accuracy. This allows builders to come out with metal buildings structure that were practically impossible in the past using the more traditional methods, some of these structures are design masterpieces often compared to art.

This makes it more important for someone in the market for metal buildings to pick a construction company specializing in metal buildings that provides personalized services depending on your requirements. This is a simple procedure as all you are required to do is investigate the companys past projects. Find out if one of their previous client is someone you know and try and contact them and inquire how they fared with them. It is also a good idea to take your project requirements to a number of constructors and get as many quotes as possible in order for you to sit down and compare their offerings on the paper rather than advertisements and then decide who would best suit your requirements.
