

A brief overview of Quonset huts

Constructors got the idea of making Quonset huts after they were successfully used in World War II, these new structures were cheap and easy to build as compared to a masonry and concrete building. The idea came from military hangars used to safeguard plane and other important assets. These could be easily assembled by hand just like a freighter and in case it had to be moved, it was as easy as taking the structure apart and rebuilding it on a different location just as it was in the previous one. Only a handful of soldiers were required to 6 meter wide and 15 meter long Quonset huts. The allies used Quonset huts to protect their soldiers, airplanes, armory and inventory from snow, rain and sunlight.

At the beginning, Quonset huts were neither good looking nor strong. They only served the purpose of being a structure and only in the sixties the construction companies realized that they needed to be stronger and look better too to be a success. Only a few decades back that could be made possible with the availability of several types of construction grade steel. Quonset huts are in demand today, both on the household and commercial building sector.

Quonset huts have several advantages in addition to being economical and stronger in comparison with a traditional masonry and concrete structure. They can easily withstand natural disasters like earthquake, floods, hurricane and Tsunami. Quonset huts are also eco friendly as the material can be reused and recycled in other buildings.

Today, Quonset huts are just another name given to steel buildings. A building that is not made in traditional style and use steel columns, blocks and sheets is a steel building. The primary construction materials used in a traditional building are bricks, concrete and wood. Compared to traditional buildings, Quonset huts are durable, safer, economic and have a higher aesthetic appeal. The most commonly used building material in Quonset huts is perforated sheets. The cost and weight of building the structure goes down when perforated sheets are used. Perforated sheets help bring the cost and weight of Quonset huts. In comparison with traditional sheets perforated sheets are easy to bend into a desired shape. It is usual these days for ware houses, storage houses, work shops, garages and more recently offices, homes and modern buildings to be Quonset huts. Even though they are called Quonset huts, their newer generations have grown into 100 storey skyscrapers.

You can now buy Quonset huts as pre fabricated units in various shapes and sizes. Engineers can design Quonset huts on his computer and the design and pattern can be made in a factory by computer controlled machines. It is difficult to tell the difference between Quonset huts and a regular masonry and concrete building. Quonset huts are now also available in many patterns, you can even order one with designer windows, plumbings, roof etc. Quite a few developers are selling Quonset huts on the internet. Once an order is placed, Quonset huts are delivered and assembled on site. If you decide to order a Quonset huts online make sure you read the offer document carefully for the materials used, time taken and then calculate the actual cost to you.
